Technology takes autism treatment to the next level

To improve the treatment of children with autism, we took Opya from its physical space and transformed it into a suite of apps to help clinicians and parents have better communication and foster collaboration.

Autism Spectrum Disorder (ASD) by providing personalized therapy services (behavior, speech, feeding & occupational).

Opya is an Autism clinic committed to treating and supporting children with

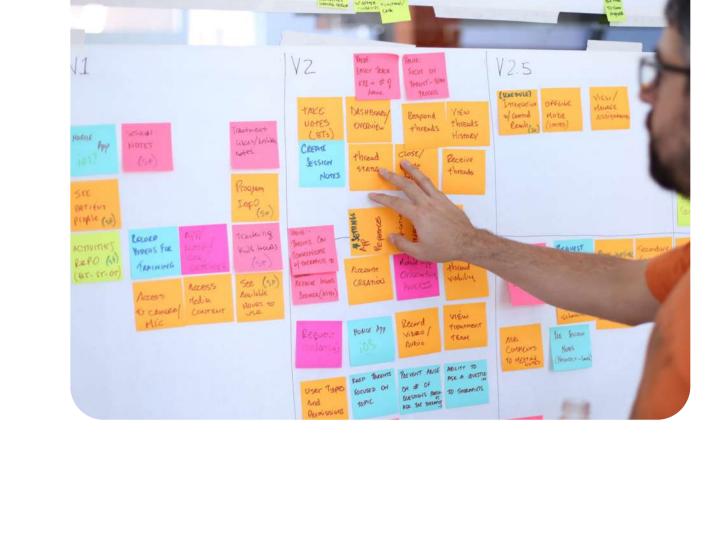

They're dedicated to delivering the most effective treatments while streamlining their services with patients and their families through a hybrid model that blends technology and in-person clinical support.

A Challenge ahead Opya envisioned that taking children's treatment to the next level requires

fostering an environment where data, collaboration, and communication were the principal assets. Being 100% offline limited them to connect with parents, track patients' daily improvements, and sharing data among therapists was difficult because it didn't allow them to make data-based decisions.

More Effective Treatment Through Faster Collaboration Our goal was to lead Opya through a digital transformation process, to enhance the

efficiency and effectiveness of autism treatment. Designing products for a delicate and intricate app ecosystem was extremely crucial for the successful adoption of users that previously had to attend in-person to keep on track with the treatment. An excellent User Experience was required to reduce response time in communications, both internally and with the patient's family. The ultimate goal was ensuring patients reach their goals at a faster pace than with traditional treatment methods.

therapy, and other points of contact. Cannot see

· Does not always receive actionable answers

Is difficult for her to understand the BCBA, data

· Not sure about how to implement therapy at

home, how to follow-up on in-home activities.

 Billing is messy and lacks of transparency. · Lack of visibility to social groups and support.

when she asks the BT questions.

NEEDS AND GOALS

and easy ways to communicate with

child's treatments and behaviors

the therapy schedule and payments.

to help them cope with the treatments.

what they need

· Transparent and understandable data on her

· Get school, therapy and other points of contact

to be aligned in terms of goals and treatments .

Needs emotional support for her and her family,

· To take care and make sure all her kids have

schedules.

Anna

Tries to be present during therapy and to attend

sports, other group-related, or social activities for

· Spends a lot of time trying to analyze the data

· She is expected to manually "centralizes" all her kid's information, coordinate, and communicate everything with all her kid's therapist.

· Deals with scheduler for scheduling and billing.

Deals with insurance company and doctors.

· Deals with teachers, tutors, other therapists

from the child's progress report.

outside the clinic etc.

· Constantly on the look-out for other music,

Ecosystem Hands-on! We went through a Discovery Phase with Opya. We gathered our Development team, UX Designers, Product Analysts and we were able to

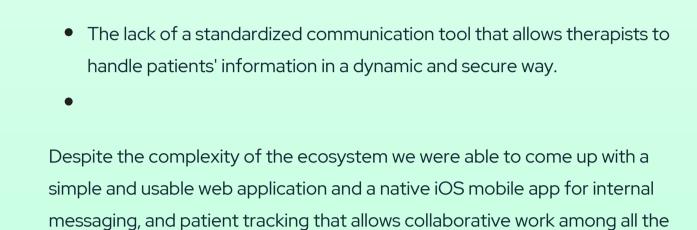

Exploring the Autism

collect all the required information, identify and define current problems, and prioritize business and user needs. We worked on an intense analysis process based on client and user feedback. Research, definition, and design process allowed us to:

 Get Making Sense and Opya on the same page quickly by understanding project goals, needs, and the current state.

- Facilitate accurate estimations about the team, time, and scope.
- Have a better holistic understanding of the project up-front. Have enough documentation to make data-driven decisions.
- Have UX documentation and a set of mock-ups to be on the same page towards where we were going to go.
- We Created a User-Centered, HIPAA-Compliant Solution We proposed a system of integrated applications to attend to different needs

and communication problems that Opya and their users were facing, such as:

professionals.

Track the child's daily mood to address treatment.

Collect, register, and integrate treatment data.

This platform allows parents and therapists to:

We also helped Opya to improve the appointment setting process, allowing them to reduce time, canceled appointments and scheduler's workload. We

developed a React Native App for parents to have a direct communication channel with the schedulers, allowing them to reschedule or request changes in their appointments. Guaranteeing the confidentiality of the information was a must in this HIPAA-Compliant project.

We decided to use Node.js and Express.js in the backend and React.js in the frontend since they're frameworks and libraries that help us to accelerate the development process, they provide high performance and product quality, allowing growth and scalability without friction. Node.js fits particularly well in this type of situation when you

Taking into consideration the target audience, application type, and functionality, our recommendation was to use Javascript as the main language.

need a fast backend to offer support to the mobile apps.

Our Tech Stack Decision

+

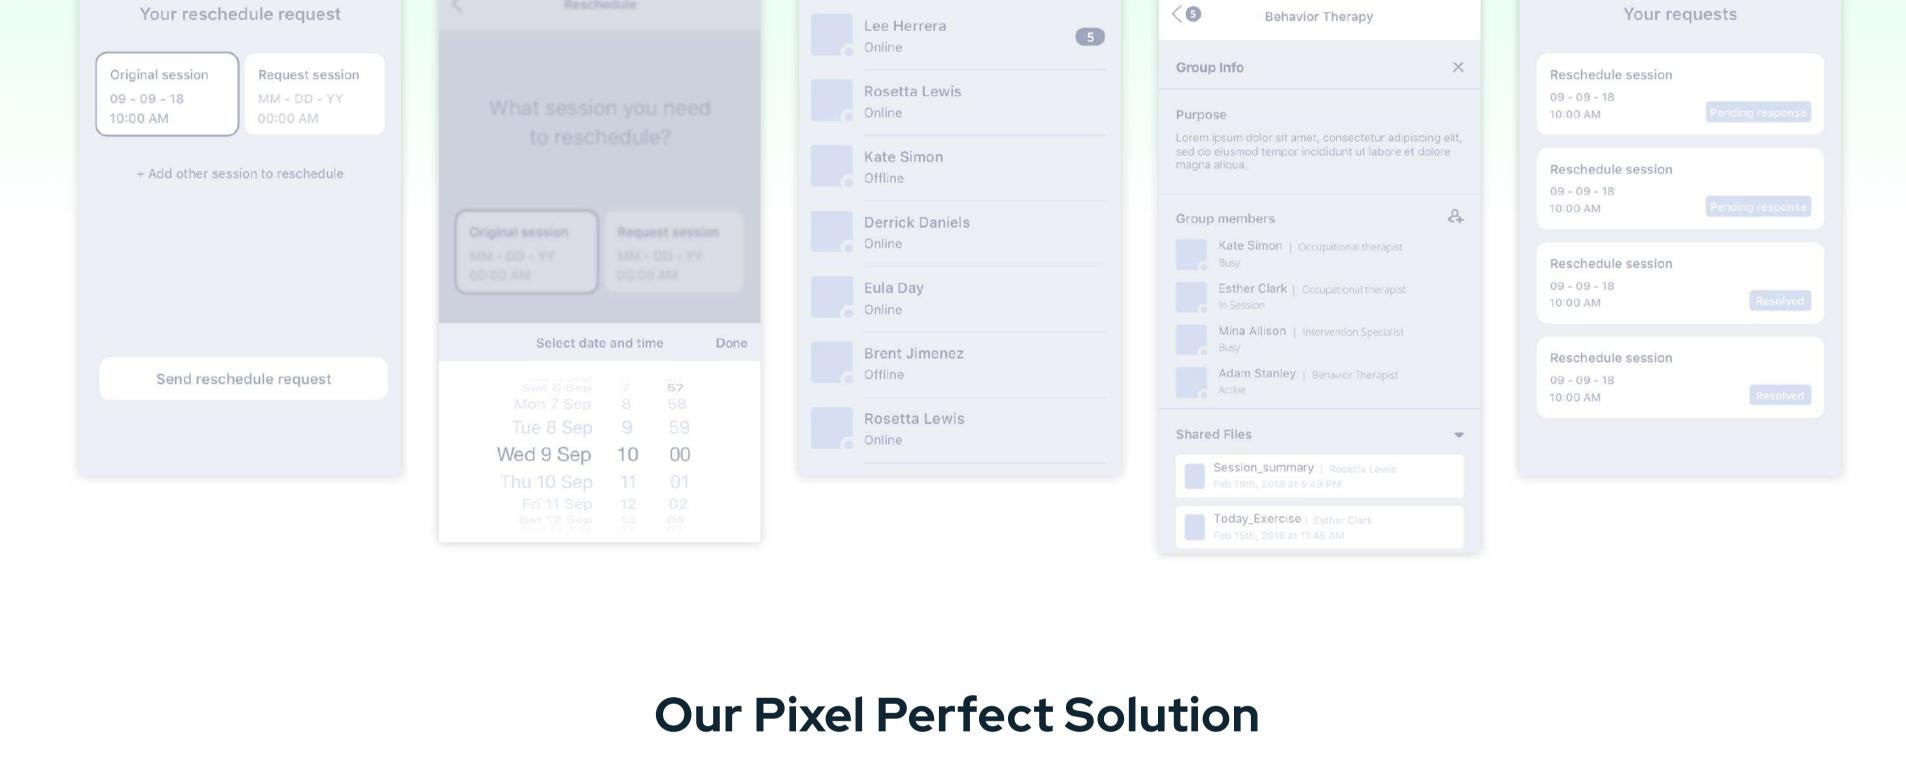

Requests

Providing a smooth and great experience was key! From the beginning, we put together a team of UX Professionals to work on this project. To speed up the process, we adopted the Git Flow model for branching and versioning. This model is well-known in the development field since it is very well-suited for collaborating and scaling in projects where more than one designer works on the same solution.
